

1 Folding as a generative model

How do you turn one pattern into a family of test problems?

- The Miura-ori parameterisation (a, b, α, θ) .
- Uniform sampling on facets, and why naive vertex sampling biases the density.
- Noise models: ambient Gaussian, on-manifold, and outliers.
- What θ does to the k -nearest-neighbour graph, and where short-circuits appear.
- Why every result downstream is a curve over θ rather than a single number.
