

1 Building crease-pattern manifolds

How do you build a manifold whose true geometry you already know?

- The `foldbench` API end to end.
- Pattern families beyond Miura-ori: Yoshimura, waterbomb.
- Product constructions: intrinsic dimension $2k$ in ambient $3k$, ground truth still exact.
- Random linear lift to arbitrary ambient dimension D .
- Why a benchmark stuck at intrinsic dimension 2 is not a serious benchmark.
